## 1. Description

The structure is a modular truss beam. Elements with different length can be mount to a straight beam.

The profile is a foldable trapezoid with 4 maintubes.
The truss is a welded structure of tubes. A drawing has to be attached to this calculation to complete it.

In the calculation the resistance and design cutting forces are determined and a table with permissible user loads is created.

The calculated values are based on the framework theory - so all loads are applied on the knotpoints.

This static calculation is applicable on all straight elements with a bracing of minimum $54^{\circ}$ to the horizontal axis on the whole length of the element. For lower angles or missing bracing the calculation is not applicable.

The folling standards have been considered:
DIN EN 1999-1-1 and DIN EN 1999-1-1/A2
This standards are binding according european building authorities.
The necessary manufacturer qualificatin is:
DIN EN 1090 - with EXC 2, or EXC 3 for temporary structures
Note:
The standard uses "eff" for different values - the calculation separates 2eff,buck" for buckling and "eff" for HAZ reasons.

## 2. Materials

Aluminium
Welding process WIG
Correction factor 0,8

\mathrm{i}_{\mathrm{y}}= & 236 \mathrm{~mm}^{3} & 0 \mathrm{~mm}
\end{array}
$$

Scheme of the cross section to calculate the profile values.
Mesasurements can be taken from manufacturers drawing.

## 6. Calculation of permissible force in main tube

## a. Tension in main tube (according 6.2.3)

General yielding along the member
$\mathrm{N}_{\mathrm{o}, \mathrm{Rd}}=\mathrm{A}_{\mathrm{g}}{ }^{*} \mathrm{f}_{0} / \gamma_{\mathrm{M} 1}=$ 131375,693 N

Local failure at a section with holes
$\mathrm{N}_{\mathrm{u}, \mathrm{Rd}}=0,9{ }^{*} \mathrm{~A}_{\text {net }}{ }^{*} \mathrm{f}_{\mathrm{u}} / \gamma_{\mathrm{M} 2}=$

- no holes in the tube

Local failure at a section with HAZ
$N_{u, R d}=A_{u, \text { eff }}{ }^{*} f_{u} / \gamma_{M 2}=A_{g}{ }^{*} \rho_{u, \text { haz }}{ }^{*} f_{u} / \gamma_{\mathrm{M} 2}=$
$68441,481 \mathrm{~N}$

## b. Compression main tube (according 6.2.4 and 6.3.1.1)

Local failure at a section with transverse welds

$$
N_{u, R d}=A_{u, \text { eff }}{ }^{*} f_{u} / \gamma_{\mathrm{M} 2}=
$$

$$
68441,481 \mathrm{~N}
$$

$\mathrm{A}_{\text {u,eff }}$ is smaler value of:
$A_{g}{ }^{*} \rho_{u, \text { haz }}=$
295,006 mm ${ }^{2}$
aufgrund Schweißnaht
$A_{\text {eff,buck }}=\quad 578,053 \mathrm{~mm}^{2} \quad$ aufgrund örtlichen Beulens bei Q.- KI. 4

Permissible force in main tube due to buckling resistance

$$
\mathrm{N}_{\mathrm{b}, \mathrm{Rd}}=\kappa^{*} \chi^{*} \omega_{\mathrm{x}}{ }^{*} \mathrm{~A}_{\mathrm{eff}, \mathrm{buck}}{ }^{*} \mathrm{f}_{0} / \gamma_{\mathrm{M} 1}=
$$

102353,188 N

Brace connection in one plane
Arc length total $\quad \mathrm{L}_{\text {ges }}=\quad 157,080 \mathrm{~mm}$

Arc length brace attachment Extent of HAZ
Arc length HAZ
Reduced thickness
$\mathrm{N}_{\mathrm{b}, \mathrm{Rd}}=\chi_{\mathrm{haz}}{ }^{*} \omega_{\mathrm{x}, \mathrm{haz}}{ }^{*} \mathrm{~A}_{\mathrm{u}, \text { eff }}{ }^{*} \mathrm{f}_{\mathrm{u}} / \gamma_{\mathrm{M} 2}=$
${ }^{1)}$ If there is no transverse bracing on the buckling length $=$ no welding (6.49a)
${ }^{2}$ ) Bracing from one plane $=$ transversal weld (6.49b)

At this design:
$\min N_{b, R d}=$

## 10. Load chart for user loads

The user loads cause a $100 \%$ maximum to the design resistance values. The interaction of local bending is considered.

The chart is useable for a simple beam with joint supports.
The loads are applied on the knot points.
Local bending caused by displaced loads is not considered.
Deflections are calculated with endless shear stifness between upper and lower chords. In reality smaler variance is possible (Bernoulli / Timoschenkow).

Considered selfweight:

$$
\mathrm{g}=\quad 0,135 \mathrm{kN} / \mathrm{m}
$$
